CONTENT QUALITY FRAMEWORK

Optimizing On-Page Content for Search & AI Discovery

A practical framework for search engines, AI search, and LLM-powered discovery

Core principle: Do not optimize content to sound like SEO content or AI content. Optimize it to contain information worth finding, understanding, trusting, and retrieving.

Evidence base: Google Search Central as the primary authority, supported by Semrush research and Microsoft Bing guidance. The document distinguishes official guidance, research findings, and editorial interpretation in the overview, then cites sources directly throughout.

September 2026

Executive Summary

The goal of modern on-page optimization is not to manufacture keyword-rich pages or compress every idea into short, “AI-friendly” sentences. It is to reduce ambiguity while increasing useful information. A strong page makes its subject, entity, category, purpose, evidence, and value explicit enough for a human reader to understand—and structured enough for search and AI systems to retrieve relevant passages.

Sources: Google Search Central — Creating helpful, reliable, people-first content · Google Search Central — Optimizing your website for generative AI features · Google Search Central — AI features and your website

Google’s current guidance is especially useful because it rejects several common “GEO” shortcuts. Foundational SEO remains relevant to Google’s generative AI features; there is no requirement to rewrite content into tiny chunks, create AI-only text files, or manufacture pages for every possible query variation. Google instead emphasizes unique, non-commodity, expert-led content, clear structure, and satisfying users.

Sources: Google Search Central — Optimizing your website for generative AI features · Google Search Essentials · Google Search Central — Spam policies

Semrush provides a secondary research layer rather than a substitute for platform guidance. Its 2026 study of AI-cited pages found positive associations with clarity and summarization, E-E-A-T signals, Q&A formatting, section structure, and structured elements. These are associations—not disclosed ranking factors—and should be treated as directional evidence, not a formula.

Sources: Semrush — Content optimization for AI search study · Semrush — How to optimize content for LLMs

This framework therefore prioritizes: Define → Explain → Prove → Help.

DEFINE: State what the company, product, service, person, or topic actually is.

EXPLAIN: Describe what it does, how it works, who it serves, and why it matters.

PROVE: Support important claims with experience, credentials, data, examples, sources, cases, or methodology.

HELP: Satisfy the user’s intent with enough context and depth to make the information genuinely useful.

How Recommendations Are Framed

This document combines official guidance from Google and Microsoft, third-party research from Semrush, and editorial principles derived from those sources. Platform guidance is cited directly. Research findings are described as associations rather than ranking factors, and practical concepts such as “inference tax” are presented as editorial interpretations—not disclosed ranking signals. Sources cited in the body link directly to the relevant documentation or study.

1. Start With Purpose, Intent, and a Clear Page Job

Google asks whether a site has a primary purpose or focus, whether content is created for an existing or intended audience, and whether the reader leaves feeling they learned enough to achieve their goal. Search Essentials also recommends using the words people use to find content in prominent and descriptive locations.

Sources: Google Search Central — Creating helpful, reliable, people-first content · Google Search Essentials

Broadness becomes a problem when adjacent topics displace the page’s core job. “Comprehensive” should not mean “mention everything remotely related.” Google’s generative-AI guidance warns against creating separate content for every possible query variation or fan-out query primarily to manipulate rankings or generative responses.

Sources: Google Search Central — Optimizing your website for generative AI features · Google Search Central — Spam policies

WEAK A payroll software page gives equal weight to payroll, HR strategy, recruiting, employee engagement, benefits, AI productivity, leadership, and workplace culture.

STRONGER The page explains payroll software, who it is for, payroll workflows, integrations, compliance support, implementation, and pricing—then links to deeper HR or benefits resources where appropriate.

WHY The stronger version keeps the page centered on the primary user intent and sends adjacent topics to dedicated pages when they deserve depth.

WEAK "Cybersecurity matters. Cloud security matters. Compliance matters. Zero trust matters."

STRONGER Explain which risks the service addresses, how assessment works, which environments are supported, what the client receives, and when a zero-trust approach is appropriate.

WHY The stronger version explains scope, process, deliverables, and conditions instead of merely mentioning related concepts.

SECTION CHECKLIST

- ☐ Can the page's primary job be stated in one sentence?
- ☐ Do adjacent topics support that job rather than compete with it?
- ☐ When a subtopic deserves depth, does the page link to a dedicated resource instead of covering it superficially?

2. Entity & Semantic Clarity: Define Before You Persuade

Homepages and major product or service pages should make the organization, offering, and category understandable in plain language. Google does not publish a "category clarity ranking factor," but its documentation repeatedly recommends descriptive titles, headings, links, visible text, and structured information that help people and systems understand a page.

Sources: Google Search Essentials · Google Search Central — SEO Starter Guide · Google Search Central — Organization structured data · Google Search Central — Influencing title links · Google Search Central — Link best practices

Category clarity before trend-led positioning

A company can participate in a trend without making the trend its primary identity. A digital experience platform, accounting platform, logistics provider, or design software company may have strong AI capabilities; that does not automatically make "AI" the clearest category for its homepage.

> **Do not sacrifice what the company is to chase what the market is currently talking about.**

WEAK "Transform marketing with AI. Personalize every moment. Unlock intelligent growth." The page never clearly states what the product is.

STRONGER "Acme is a digital experience platform for enterprise content, personalization, and customer journeys. Its AI capabilities help marketing teams automate content operations and personalize experiences at scale."

WHY The stronger version establishes the core product category first, then positions AI as a capability of that product.

WEAK "Build the future with intelligent automation."

STRONGER "Northstar manufactures industrial robotics systems for automotive and electronics assembly, with computer-vision and AI automation capabilities."

WHY The stronger version states what the company actually makes and where it is used; AI supports the category instead of replacing it.

Descriptive text vs. problem-led copy

Problem-led copy is useful because it connects an offering to a customer need. It becomes weak when it replaces descriptive content. If a page only says "modernize faster," "unlock growth," and "transform

experiences," the reader must infer what is being sold. Search and AI systems can infer relationships, but there is little editorial benefit in withholding accurate facts that can be stated naturally.

Sources: Google Search Essentials · Google Search Central — Influencing title links · Google Search Central — Link best practices · Microsoft Bing Webmaster Tools — AI Performance

WEAK "Hiring takes too long. Your best candidates disappear while your team is buried in manual work. Move faster with us."

STRONGER "BrightHire is applicant-tracking software for mid-sized recruiting teams. It centralizes candidate pipelines, interview scheduling, scorecards, and hiring analytics so teams can reduce manual coordination."

WHY The stronger version identifies the product, audience, core functions, and problem solved without forcing the reader to infer what is being offered.

WEAK "We help organizations innovate, transform, and scale with confidence."

STRONGER "We are a product design and software engineering consultancy that designs digital products, modernizes web applications, and builds data platforms for enterprise teams."

WHY The stronger version replaces generic transformation language with a clear business category and named services.

Reduce the "inference tax"

> **Do not make people—or machines—infer information you can state accurately and naturally. The "inference tax" is the number of important facts a reader must guess before they can answer basic questions: What is this? What does it do? Who is it for? Where does it operate? Why is it qualified?**

A useful internal asset is a canonical business description: "[Company] is a [primary category] specializing in [core capabilities] for [primary audience/market]." It does not need to be copied word-for-word across the site; it serves as a factual reference point so homepage, About, service, product, and AI pages remain compatible.

Sources: Google Search Central — Organization structured data · Google Search Central — Sitelinks and site structure · Google Search Central — Link best practices

The answerability test

Ask whether a new employee—or a retrieval system—could answer the following from explicit page content rather than inference: what the entity is; what category it belongs to; what it does; who it serves; where it operates; its core capabilities; and what evidence supports its claims. This is a clarity test, not a Google ranking test.

Sources: Microsoft Bing Webmaster Tools — AI Performance · Semrush — How to optimize content for LLMs

SECTION CHECKLIST

- ☐ Does the page explicitly state what the company, product, or service is and its primary category?
- ☐ Are core products, services, capabilities, audiences, and markets named rather than implied?
- ☐ Does problem-led copy sit alongside enough descriptive context to identify the offering?
- ☐ Are the organization's core facts consistent across major pages?

3. Depth Over Broadness: Avoid Thin, Fragmented Content

Short sentences are not inherently bad. Neither are short paragraphs. The risk is a page made of statements that never explain, qualify, or prove anything. Google asks whether content provides a substantial, complete description, insightful information beyond the obvious, original analysis, and substantial additional value. Its generative-AI guide also says publishers do not need to break content into tiny pieces for AI to understand it.

Sources: Google Search Central — Creating helpful, reliable, people-first content · Google Search Central — Optimizing your website for generative AI features

Semrush research does find positive associations between AI citations and clear summaries, Q&A patterns, and section structure. That supports scanability—not intellectual shallowness. A direct answer can be followed by context, evidence, exceptions, and examples.

Sources: Semrush — Content optimization for AI search study · Semrush — How to optimize content for LLMs

WEAK "Solar panels can lower energy costs. They are sustainable. Installation is simple. Contact us to learn more."

STRONGER "Residential solar can reduce grid electricity purchases, but savings depend on local rates, roof orientation, system size, financing, incentives, and household consumption. A site assessment should estimate annual production against historical usage before sizing the system."

WHY The stronger version adds the conditions that determine outcomes, making the statement useful rather than simply promotional.

WEAK "Backups protect your data. Ransomware is dangerous. Recovery matters. Test your backups."

STRONGER "A backup is only useful if it can be restored. For ransomware resilience, organizations should separate backup copies from production credentials, define recovery-point and recovery-time objectives, and test restoration procedures on a schedule."

WHY The stronger version explains why recovery matters and describes the practices that make backups more resilient.

Optimize information, not sentence count. Clarity can be concise; expertise usually requires context.

SECTION CHECKLIST

- ☐ Does each major claim receive enough explanation to be useful?
- ☐ Does the page explain relevant how, why, when, for whom, conditions, or limitations?
- ☐ Are short sentences improving clarity rather than replacing necessary context?

4. Specificity and Information Density

Specificity turns generic claims into information. Dates, quantities, locations, named technologies, process steps, audiences, qualifications, methodologies, constraints, and examples make a page more concrete and verifiable. Google encourages evidence of expertise, original information, and substantial additional value; Semrush similarly recommends citable statistics and proprietary insights in AI-oriented content.

Sources: Google Search Central — Creating helpful, reliable, people-first content · Google Search Central — Optimizing your website for generative AI features · Semrush — How to optimize content for AI search engines · Semrush — Content optimization for AI search study

WEAK "Our firm has extensive experience and provides high-quality financial guidance."

STRONGER "The firm has advised family-owned businesses on succession planning since 2008. Its advisory team includes CPAs and CFP professionals, and engagements typically cover ownership transfer, tax coordination, liquidity planning, and governance."

WHY The stronger version turns a vague experience claim into verifiable information: timeframe, qualifications, audience, and scope of work.

WEAK "Our coffee is carefully sourced for exceptional quality."

STRONGER "The roastery buys traceable lots from producers and cooperatives in Colombia, Ethiopia, and Guatemala, publishes roast dates on every bag, and profiles each coffee by origin, process, variety, and recommended brew method."

WHY The stronger version replaces an unsupported quality claim with traceable sourcing and concrete product information.

A Practical Specificity Ladder

Level 1 — Vague: We provide innovative technology solutions.

Level 2 — Category: We provide software development services.

Level 3 — Specific: We provide custom software development, cloud modernization, data engineering, and AI development.

Level 4 — Contextual: We provide those services for mid-market and enterprise organizations with complex legacy environments.

Level 5 — Evidence-backed: Add relevant years of experience, industries, technologies, delivery examples, outcomes, credentials, methodology, and verifiable evidence.

Not every sentence should be Level 5. The goal is to ensure the page contains enough Level 3–5 information that its meaning is not carried by generic claims.

SECTION CHECKLIST

- ☐ Does each important section include at least one entity-, product-, experience-, methodology-, or evidence-specific detail?
- ☐ Are claims such as experienced, leading, advanced, secure, fast, or high-quality supported?
- ☐ Where experience influences trust, is there verifiable evidence such as years, volume, credentials, case history, customers served, or implementations?

5. E-E-A-T: Make Trust and Expertise Visible

Google describes E-E-A-T as experience, expertise, authoritativeness, and trustworthiness, with trust being the most important component. Google also says E-E-A-T is not itself a single ranking factor. The practical takeaway is to make the reasons a reader should trust the page visible: who created it, what relevant experience or expertise they have, how claims are supported, and why the content exists.

Sources: Google Search Central — Creating helpful, reliable, people-first content · Semrush — What is E-E-A-T in SEO?

Google recommends evaluating content through “Who, How, and Why.” It asks whether authorship is clear where expected, whether bylines lead to background about the author, whether content demonstrates first-hand expertise, and whether the primary purpose is to help people rather than attract search visits.

Sources: Google Search Central — Creating helpful, reliable, people-first content · Google Search Central — Guidance on generative AI content

WEAK “Our technicians are experts in restoring historic homes.”

STRONGER “Restoration projects are led by preservation carpenters with experience in sash-window repair, lime plaster, traditional joinery, and work on pre-1940 properties. Project pages identify the techniques and materials used.”

WHY The stronger version demonstrates expertise through specific techniques and project context rather than asserting expertise as a label.

WEAK “Written by our nutrition team.”

STRONGER “Written by [Name], RD; reviewed by [Name], MD. The page links to credentials, identifies the review date, and cites primary clinical guidance for medical claims.”

WHY The stronger version identifies accountable people, relevant credentials, a review process, and the evidence behind medical claims.

SECTION CHECKLIST

- ☐ When expertise matters, is it clear who created or reviewed the content?
- ☐ Does the page or linked profile establish relevant qualifications or first-hand experience?
- ☐ Are important trust claims supported by evidence, examples, methodology, or reliable sources?

6. YMYL: Raise the Evidence Standard

Google says its systems give more weight to strong E-E-A-T for topics that can significantly affect health, financial stability, safety, or societal welfare—areas commonly described as Your Money or Your Life (YMYL). The cost of inaccurate, unsupported, or misleading information is higher, so the editorial standard should move from “plausible and readable” to “appropriately qualified, sourced, current, balanced, and reviewable.”

Sources: Google Search Central — Creating helpful, reliable, people-first content · Google Search Central — Byline dates

WEAK “This treatment is safe, fast, and gets you back to normal quickly.”

STRONGER Define the treatment, typical indications, material risks, alternatives, recovery variability, who evaluates candidacy, and which claims are supported by clinical or regulatory sources.

WHY The stronger direction avoids an unsupported guarantee and includes the information a reader needs to understand candidacy, tradeoffs, and uncertainty.

WEAK “This investment strategy can help you build wealth with less risk.”

STRONGER Define the strategy, explain risk and time horizon, distinguish historical performance from future outcomes, disclose assumptions or fees where relevant, and identify the qualified author or reviewer.

WHY The stronger direction gives the claim appropriate financial context by defining risk, time horizon, assumptions, and qualified authorship.

SECTION CHECKLIST

- ☐ Are high-impact claims supported by reliable, preferably primary or authoritative sources?
- ☐ Is the author or reviewer appropriately qualified for the claim being made?
- ☐ Are material risks, limitations, uncertainty, alternatives, and current statistics represented where relevant?

7. Claim → Explanation → Evidence → Relevance

Many weak pages stop at the claim. Stronger pages explain the claim, support it, and tell the reader why it matters. This is an editorial framework—not a disclosed Google formula—but it maps closely to Google’s emphasis on substantial descriptions, expertise, clear sourcing, and added value.

Sources: Google Search Central — Creating helpful, reliable, people-first content

WEAK “Our platform is enterprise-ready.”

STRONGER “The platform supports SSO/SAML, role-based permissions, audit logs, regional data hosting, and documented APIs. Enterprise plans include security-review support and defined support SLAs.”

WHY The stronger version defines “enterprise-ready” through concrete security, administration, hosting, API, and support capabilities.

WEAK “Our hotel is ideal for business travelers.”

STRONGER “The hotel is a five-minute walk from the convention center, offers 24-hour check-in, in-room desks, 500 Mbps Wi-Fi, early breakfast from 6:00 a.m., and bookable meeting rooms.”

WHY The stronger version turns a subjective claim into decision-relevant facts a business traveler can actually evaluate.

Use the “So what?” test during editing. If a sentence says “we have decades of experience,” ask: doing what, in which context, and why is that experience relevant to the decision? If it says “advanced technology,” ask: which technology and what does it enable?

SECTION CHECKLIST

- ☐ For each major claim, can the page answer “how do we know?”
- ☐ Are proof points located close to the claims they support?
- ☐ Are outcomes described without implying guarantees the evidence cannot support?

8. Non-Commodity Content and Information Gain

Google's 2026 generative-AI guidance explicitly recommends unique, non-commodity content: first-hand perspectives, in-depth experience, and material that does more than recycle what is already on the web or what a generative model could easily produce. Google's people-first guidance similarly asks whether a page provides original information, reporting, research, analysis, and substantial additional value.

Sources: Google Search Central — Optimizing your website for generative AI features · Google Search Central — Creating helpful, reliable, people-first content

This changes the planning question. Instead of "How many words should this page have?" ask "What information will this page contribute?" Google says there is no ideal page length for generative AI search and cautions against writing to a preferred word count. More words are not automatically more useful; fewer words are not automatically more AI-friendly.

Sources: Google Search Central — Optimizing your website for generative AI features · Google Search Central — Creating helpful, reliable, people-first content

WEAK "10 Tips for Choosing a Moving Company" assembled from common advice already present across hundreds of pages.

STRONGER A mover publishes its pre-move inspection checklist, explains the three causes of unexpected charges it sees most often, shows anonymized examples, and provides a calculator based on its actual estimating process.

WHY The stronger version contributes first-hand operational knowledge, examples, and methodology instead of repackaging a common listicle.

WEAK "What Is Product Discovery?" summarized from standard definitions.

STRONGER A product team analyzes 50 discovery projects, identifies where stakeholder interviews most often fail, explains its research method, and publishes patterns with examples and limitations.

WHY The stronger version contributes original data, a stated method, observed patterns, and limitations rather than repeating a standard definition.

SECTION CHECKLIST

- ☐ Does the page contain original experience, data, cases, examples, methodology, observations, or analysis?
- ☐ Does at least some of the page require organization-specific or expert input rather than generic model knowledge?
- ☐ Is additional length adding information rather than simply adding words?

9. Structure for Humans First — and Retrieval Second

Good structure makes depth navigable. Google recommends organizing content with paragraphs, sections, and headings that create a clear structure. It also says AI features require no special AI markup or machine-readable AI text files. Semrush's citation study found positive associations with clear summaries, Q&A formatting, section structure, and structured elements; Bing recommends descriptive headings, concise sections, tables, and FAQ-style content where useful.

Sources: Google Search Central — Optimizing your website for generative AI features · Google Search Central — AI features and your website · Semrush — Content optimization for AI search study · Microsoft Bing Webmaster Tools — AI Performance

The practical balance is simple: answer direct questions directly, then provide the detail necessary to understand the answer. Do not turn every section into a two-sentence "chunk" if the topic needs nuance, and do not add FAQs merely because a tool recommends them.

WEAK H2: Is migration hard? “Migration can be hard. Planning helps.” H2: Is testing important? “Yes. Testing reduces risk.”

STRONGER H2: Migration planning. Open with a direct summary, then explain dependencies, data mapping, cutover strategy, testing, rollback, ownership, and common failure modes.

WHY The stronger version remains scannable while giving enough depth to understand dependencies, execution, and failure points.

SECTION CHECKLIST

- ☐ Do headings accurately describe the content beneath them?
- ☐ Do direct-answer summaries lead into adequate supporting detail when the topic requires it?
- ☐ Is important information available as visible text rather than only in images, animations, or inaccessible UI?

10. On-Page Signals: Titles, Headings, Snippets, Links, and Dates

The content body is not the only descriptive surface. Google recommends descriptive, concise title elements; unique and accurate meta descriptions; informative headings; relevant anchor text; logical site structure; and meaningful visible dates where publication or update timing matters. Google may generate snippets primarily from page content, so a vague body cannot be rescued by a good meta description alone.

Sources: Google Search Central — Influencing title links · Google Search Central — Control snippets in search results · Google Search Central — Link best practices · Google Search Central — Sitelinks and site structure · Google Search Central — Byline dates

WEAK Home | Acme

STRONGER Acme | Inventory Management Software for Multi-Location Retailers

WHY The stronger title tells both people and search systems what the entity is, what the page is about, and who the product serves.

WEAK Learn more →

STRONGER Explore our warehouse inventory integrations →

WHY The stronger link describes the destination and relationship instead of making the reader interpret a generic “learn more” label.

WEAK “Updated today” after changing punctuation.

STRONGER Update the content when facts, recommendations, products, evidence, or methodology materially change; show a truthful modified date when it helps the reader.

WHY The stronger approach uses dates to communicate real content freshness, not to manufacture the appearance of recency.

SECTION CHECKLIST

- ☐ Do the title, H1, headings, and visible copy accurately describe the page?
- ☐ Are meta descriptions, links, and anchor text specific and natural rather than vague or stuffed?
- ☐ Where dates matter, are publication and update dates truthful and consistent with the content?

11. AI-Assisted Content: Use AI to Improve Work, Not Replace Knowledge

Google does not prohibit content simply because generative AI was used. Its concern is value and purpose: generating many pages without adding value can violate scaled-content-abuse policies. Google says generative

AI can be useful in content workflows, but the finished work should meet Search Essentials and people-first standards.

Sources: Google Search Central — Guidance on generative AI content · Google Search Central — Spam policies · Google Search Essentials

A productive workflow uses AI to organize interviews, identify unanswered questions, improve clarity, compare drafts, or transform expert notes—while humans and subject-matter experts remain responsible for facts, original insight, evidence, judgment, and final quality. Semrush's current AI-content research similarly emphasizes originality and usefulness over simplistic "AI vs. human" labels.

Sources: Semrush — SEO content guide for search and AI · Semrush — How to optimize content for AI search engines

WEAK Prompt: "Write 50 location pages for our service. Change the city name and a few sentences."

STRONGER Interview local operators about regulations, lead times, service boundaries, common problems, pricing factors, and case examples; use AI to structure and edit the resulting original information.

WHY The stronger workflow uses AI to structure original, locally informed inputs rather than scaling near-duplicate pages around query variations.

SECTION CHECKLIST

- ☐ Has every factual claim been reviewed for accuracy?
- ☐ Does the page contain expert or organization-specific input beyond generic model output?
- ☐ Are we avoiding scaled pages created primarily to capture keyword or query variations?

Master On-Page Content Checklist

Use the core checks on every page. Use the conditional checks only when they apply. The goal is a compact, observable audit—not a subjective scoring exercise.

Core checks — use on every page

☐ Is the page's primary purpose clear and focused on one recognizable intent?

☐ Does the page explicitly state what the company, product, service, or topic is?

☐ On major brand pages, is the primary category clear rather than replaced by trend language?

☐ Are core products, services, capabilities, audiences, or concepts explicitly named rather than implied?

☐ Does problem-led marketing copy include enough descriptive context to identify the offering?

☐ Do adjacent topics support the core topic rather than dilute it?

☐ Does each major claim receive enough explanation to be useful?

☐ Does each important section contain at least one concrete entity-, product-, experience-, methodology-, or evidence-specific detail?

☐ Are material claims such as experienced, leading, advanced, secure, fast, or high-quality supported?

☐ Does the page contain original experience, cases, examples, data, analysis, methodology, or expert input?

☐ Do the title, H1, headings, and visible copy accurately describe the page?

☐ Do concise answers lead into supporting detail when nuance is required?

☐ Is important information available as visible, accessible text?

☐ Are keywords and anchor text natural and descriptive rather than stuffed?

☐ Can a reader explicitly answer what this is, what it does, who it serves, and why it is credible without guessing?

Conditional checks — use when relevant

☐ If experience influences trust, is there verifiable evidence such as years, volume, credentials, implementations, customers served, or case history?

☐ If expertise matters, is it clear who created or reviewed the content and why they are qualified?

☐ For YMYL topics, are high-impact claims supported by authoritative sources and are material risks, uncertainty, and limitations represented?

☐ If statistics or time-sensitive facts are used, are they current, sourced, and contextualized?

☐ If structured data is used, does it accurately match visible page information?

☐ If publication/update dates are shown, do they reflect meaningful content changes rather than cosmetic freshness?

☐ If AI assisted production, were facts, expert judgment, and original inputs independently reviewed?

☐ If multiple pages target closely related queries, does each page have a distinct user purpose rather than being a scaled variation?

A page does not need to maximize every possible signal. It should clearly define its subject, explain what matters, prove consequential claims, and help the intended reader complete the page's job.

Sources & Further Reading

Primary authority is intentionally weighted toward Google Search Central. Semrush is used as a secondary source for AI-search research and editorial observations. Microsoft Bing is included where it provides explicit information about AI citation visibility and content best practices.
